## TutorStack 2019

A multi-layer technology stack providing a modular, free and/or open solution to online & blended delivery without product or vendor lock-in

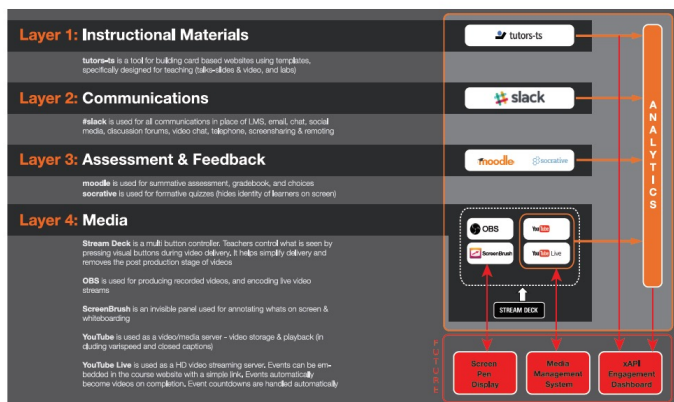

### What?

TutorStack is an integrated technology solution which splits the key elements of delivering online into 4 layers (Instructional Materials, Communications, Assessment & Feedback, and Media). Technologies were chosen based on their effectiveness, cost, aesthetics, ease of use, and functionality. After two years of researching, reviewing, implementing, deploying, hot-swapping, testing, and implementing feedback on alternate solutions for each layer, we present a preferred solution for simplifying high quality online delivery. The software presented is free or open source.

### Why?

For many, Virtual Learning Environments (VLEs) have become end points rather than starting points for online delivery. The limitations of a one size fits all solution inevitably comes to the fore including over complexity, aesthetics, and vendor/product lock-in.

What's needed is the ability to swap-in alternatives at any time as better technological solutions become available. TutorStack aims to avoid this vendor/product lock-in and take advantage of better technologies as they become available.

### Results

For staff, technology has been made transparent, accessible, with a similar workflow for sync & async delivery. Increased online adoption from staff to 50 resulting in 3 additional studios being built to support the activity. Higher quality media & production times significantly reduced using the simpler UX of TutorStack.

Feedback from students highlights excellent ASX, increased demand for live online classes with preferred engagement activities utilised by TutorStack.

Watch video

### Future Development

1. Use of **screen pen displays** to provide operating system independent natural pen annotation
2. Alternative cloud based **media management system** to simplify reuse of media.
3. Utilize **xAPI** to bring analytics & engagement data from each layer together in an **engagement dashboards**. This will provide easier, better and more complete learner views to aid in early intervention systems for learner engagement and retention.

## WIT CTCL PODS

Low cost, fully specified, physical studios enabling teachers practice & deliver blended & online courses, in high definition sync & async modes

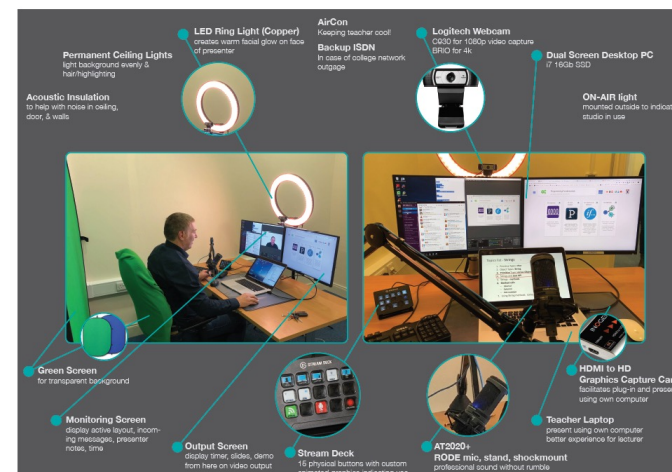

### Introduction

TV studios can be intimidating spaces. WIT CTCL PODs are a reaction to the uneasiness felt when trying to create online video based classes especially for novices. A ground-up demand from staff for simple, quiet, private spaces, to experiment, practice and deliver online, resulted in a room being set aside as a make or break lab for practicing online delivery in private with support if needed. A key feature was to use inexpensive equipment producing good enough quality without tying up more elaborate expensive studios and technicians. This makes the solution scalable. Such has been the success that after just one year, the original space was replicated as demand grew, and two more were established. The rooms were renamed POD1, POD2 and POD3 hence the poster title. They contain the hardware in a ready-to-go state and support online delivery, including the technologies used in TutorStack.

### Implementation

Starting with a powerful PC & monitor, running Adobe Connect, the mic & webcam were changed to improve quality. Adobe Connect was substituted for TutorStack (OBS/YouTube for high quality video). OBS supports Chroma-keying so a green screen background was added. Different lighting setups were trialed & the ring light was favoured. After a semester of testing, the message was clear, single handed online video delivery was too difficult for most. Two pieces of hardware solved this problem: An Inogeni graphics capture card enabled lectures to present the way they normally do in IT using their own laptop. Another benefit of this card was that video encoding and streaming could be off-loaded to the powerful PC freeing up resources on the lecturer's laptop. Stream Deck completed the user experience by providing a simplified interface to OBS and YouTube with technical details abstracted away into reusable profiles & templates.

### Results

The PODs now provide a ready-to-go hardware setup to accompany the free/open TutorStack modular software solution with its simpler user experience UX, which has made the technology transparent, accessible, less mysterious, and with a lower cognitive load. Online video teaching is now seen as feasible with increased online adoption by teaching staff utilising the PODs now numbering 50, and a growing community of practice (CoP). Higher quantities of higher quality media artefacts are now being produced regularly, and production & publishing times have been significantly reduced. Setup times for new practitioners have been reduced. Workflows for sync & async delivery are now very similar.

### Future Development

1. Installation of **screen pen displays** to provide operating system independent natural pen annotation
2. Completion of **hardware upgrades** and replacements including cameras and permanent green screens.
3. Completion of **acoustic treatments** to the walls and doors.
4. Installation of a **lightbox** in one of the pods.

As part of the TutorStack layer2 Communications/Community we've integrated Zoom with Slack. In Aug 2019, Slack ended development of remote screen sharing instead leaving it to the leading experts ZOOM.

**Zoom** is particularly good for latency free live introductions, Q&A, and very natural discussion (unlike MS-Teams). Breakouts enable Group Discussion. Zoom also integrates with the rest of the TutorStack e.g. our pre-existing media layer technologies can be seen as a virtual webcam within Zoom. If using Slack for communications then disable Zoom chat. The following guides were produced to help people utilize Zoom's features quickly:

### Zoom QuickStart

### Zoom Chat Settings

<https://youtu.be/Q7KVIva3xqQ>

### Zoom Breakout Rooms

<https://www.youtube.com/watch?v=w8Uwy-9YXkY>

**Zoom 5.2** has great features for teachers - suppress fan noise, lighting, resizable and movable green screened video over presentations to name a few.
